

P5 CLASSIFICATION WIRING DEMONSTRATION. This document is a durable Transflow P5 showcase. It verifies that a complete PDF is enumerated, classified through ModelDecisionPort, routed to the single-column page pipeline, translated by a deterministic fixed test adapter, rendered with the controlled font registry, and finalized as one immutable PDF artifact. The real Qwen anonymous quality result is stored separately under test-results. The paragraph is intentionally long enough to exercise the body and flow-text rules. No file name, company name, sample identifier, page label, or expected route is exposed to the classification evidence. This source page contains native PDF text and does not depend on OCR, HTML, Chrome, system-font discovery, or page-level PDF concatenation. The final Chinese text is fixed test data for wiring verification only.
